WATERSHED CONDITIONS BULLETIN

A Watershed Conditions Bulletin is issued to raise awareness about a change or potential change in conditions in local waterways.

DATE: January 25, 2010
PAGES: 2
DETAILS:

Quinte Conservation is advising local municipalities and watershed residents regarding changing conditions in local watersheds. Rainfall and warm temperatures have resulted in increased water levels in all watercourses. Smaller rivers and creeks have been rising for the last 24 hours and should peak today or tomorrow. These waterways have or will reach their normal spring levels.

Larger rivers will continue to rise for the next few days. While major flooding is not expected, increased flows create the potential for ice jams. Quinte Conservation personnel are monitoring watershed conditions closely. At this time there are no reports of roads flooding. Weather forecasts indicate that the rain should end late this afternoon, with temperatures ranging from minus 5 Celsius to plus 2 between now and Wednesday.

Quinte Conservation staff monitor water levels and weather forecasts carefully as part of the agency's flood forecasting and warning program. Quinte Conservation's area of concern includes the drainage basins of the Moira, Salmon and Napanee Rivers and their tributaries, and all of Prince Edward County.
